*The absorption of the room is not considered. Column for any room from that height at the same volume of air per diffuser (isothermal values)
 ** determined by considering an absorption of the piece of 10 dB. Column in reference to the example

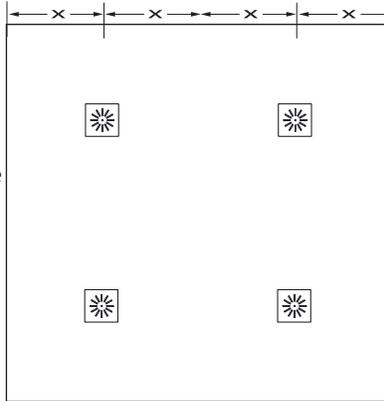

Specifications :

- Room: L x W x H = 10 m x 10 m x 2.44m (33 ft x 33 ft x 8 ft)
- Total air flow in the room : 1400 cfm ④
- Initial temperature difference: ΔT = -10°C
- Air velocity : 0.15 m/s (30 ft/m) 1.3 m (4.25 ft) from the floor
- VAV : 25%

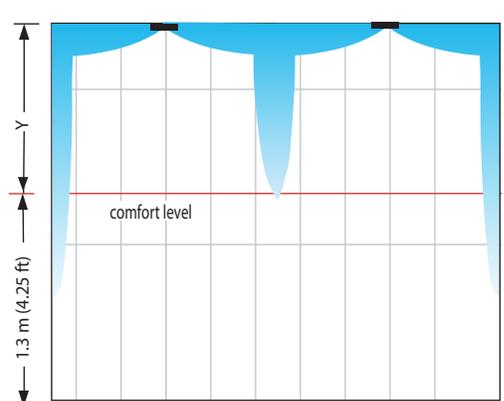

Using the data on ceiling height ① and airflow rate by surface (m² or sq. ft.²), ② choose the nominal size (DN) of the DAL 358. ③

Divide the total airflow rate of the room ④ by the ideal value ⑤ of the air flow rate for the selected size. Adjust the quantity of diffusers to achieve symmetry in the room while respecting the maximum airflow rate in the optimal setting range. Watch for minimal distance between diffusers ⑥ and walls. ⑦

Location of the diffusers

Air flow pattern - DN 600

Scale grid: 1 m Blue: Air velocity >= 0.15 [m/s]

 = Minimum range of application (For minimum application in V.A.V.) = Optimal range of application (Maximum standard volume for office building) = Maximal range of application (Noise level higher than 33 (43-10) dBA)
